## ■ 3. FOAM PIPE (FP)

### FOAM PIPE WITH DEFLECTOR (FPD)

The foam pipe ("Foam Pipe" = FP) is used to produce low-expansion foam; the discharge of water, however, is also possible. In foam operation mode, both the aspirated air and the foam agent/water mixture result in the generation of foam. The foam pipe is typically used to produce heavy foam at foam expansion rates of up to 15 (depending on the foam agent type and the operational parameters).

The deflector ("Foam Pipe Deflector") allows to form a two-dimensional spray jet as an alternative to the straight foam jet, enabling the foam discharge across a large surface. The linear drive mounted on the deflector allows stepless opening and closing also during operation. The nozzle is factory-set to a fixed extinguishing agent flow rate in accordance with the available system pressure. If requested, this setting can be adjusted later on.

## ■ 4. REACH AND REACTION FORCE.

Using the app at [www.firedos.com/monitorapp](http://www.firedos.com/monitorapp), you can determine the reach curve and the reaction forces depending on your operating conditions.

### INPUT PARAMETERS

■ **MONITOR TYPE**  ▼  
Monitor with a maximum water flow rate of up to 2000 l/min. Electric adjustment possible only.

■ **NOZZLE TYPE**  ▼  
The multi-purpose nozzle (MPN) is used to discharge either water or premix at a low expansion rate. Stepless adjustment between hollow jet and spray jet is possible.
